
How many great meals have you missed because you couldn't read the sign? *And how many stories* — 20 years of craft, a mother's recipe, a recipe carried from Udon Thani — have you walked past without ever knowing?

soifood

THE PROBLEM

two problems.

01 — friction

Translation apps exist. Nobody has time.

The vendor is cooking. The customer is hungry. There's a queue.
The interaction fails before it starts.

02 — invisibility

Extraordinary stories, told to no one.

Recipes passed through generations. Families fed. Decades of craft. Those stories exist only in the memories of regulars who already know them.

THE SOLUTION

*one qr code.
both problems solved.*

Bilingual presence

Vendor onboards in Thai. Customers read in English. Same profile, two languages, no friction.

"Auntie Noi has been cooking her late mother's pad thai recipe since she was 18 — over 22 years at Silom Night Market."

Frictionless ordering

Bilingual menu. Full-screen Thai order card shown back. Audio plays the order aloud for the vendor.

Free web presence

A shareable microsite. Google-listing ready. A QR code, printable and pinned to the stall.

soi — Thai for alley. The narrow streets of Bangkok where the best food hides. That's where our vendors are. That's where the name comes from.

THE FLOW

how it works

01

Vendor onboards in Thai

Six questions. Five minutes. Free. Their story, in their words.

02

English presence generated

AI writes the profile, bilingual menu, QR code and shareable microsite.

03

Customer discovers + orders

Scans the QR. Reads in English. Taps the dish. A full-screen Thai order card appears.

04

Vendor hears the order

Audio reads the order aloud in Thai. Vendor is cooking. No screen needed.

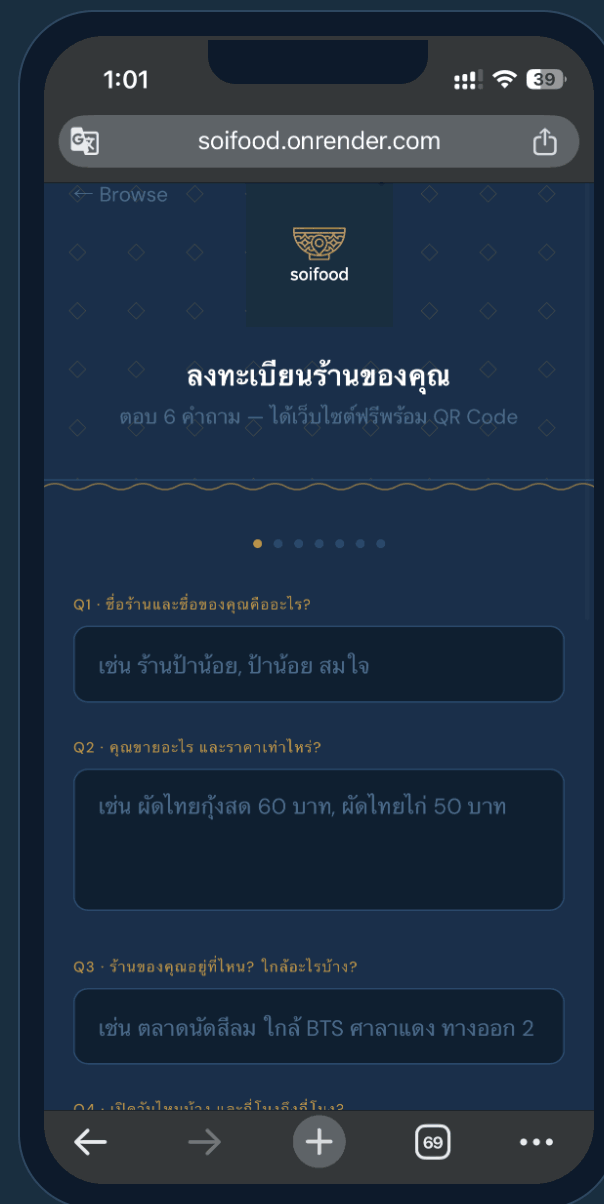

05

Community builds the story

Customer checks in. Earns leaderboard points. Leaves a note. The story grows.

WHAT COMES NEXT

future possibilities

— *credit signals*

Every check-in is a behavioral signal.

Over time, these signals can be used by financial institutions as indicators of creditworthiness — the first formal credit footprint for an unbanked vendor.

— *SEA expansion*

One model. Every street food city.

The soifood model can be replicated in every Southeast Asian city with a street food culture. The same story repeats — extraordinary vendors, confused visitors, zero digital presence.
